Huashan 1914

We once acquired a discarded light fixture that was said to be controllable via Arduino. Unfortunately, the memory card that stored the code might have been damaged over time, rendering all control and switching functions inoperative, leaving only a circuit board capable of powering on. This led us to reflect on how digital data can be lost due to various causes, such as electromagnetic interference. From this observation, we identified three potential challenges facing humanity in an age highly dependent on digital technology: storage, CPU-base logic, and binary arithmetic.

01110100 01101111 adopts a media archaeology perspective to explore the digital and cultural layers embedded in digital cultural assets and contemporary computer logic. At the same time, through the repurposing of technological forms, we seek to re-examine and re-engage with modern technologies.

Laval Virtual 2024 #Experience _ Selected

02 Virtual Reality Art_ZHAN

The title 'Zhan' means watching or looking forward in Chinese, which taken from the form and meaning of "Guãn Luò Yin". "Guan Luò Yin" is an ancient ritual ledding by an experienced Taoist priest. During the ritual, participants are blindfolded with a black or red cloth. This practice aims to resolve issues that cannot be easily solved in the physical world, such as meeting departed loved one.

In Taiwan's tech culture, VR experience is often used to draw parallels with Gun Luò Yin since both block the viewer's view, immersing them in alternate realities. Despite the similarities, there are three states prevailing VR hasn't reached currently: the Un-replicable Experience, the Incomplete Spiritual Journey, and 'Transcendence of Consciousness.

'Zhan' seeks to bridge this gap by conceptualizing a hybrid of VR and experimental performance. Through the fusion of VR, live performance, and AI-generated real-time images, endowing VR with these characteristics.

Employing AI as a spiritual entity, we provide superconscious imagery based on audience descriptions within VR headsets in real-time. The artists, akin to priests, act as intermediaries between audiences and AI, building a co-creative environment involving viewers, actors, and AI, aiming to create an individual differences environment to achieve the statements.

We reexamine how VR can retrieve' the essence of Guãn Luò Yin, heralding its potential future in real-time and subconscious experiences during this work.

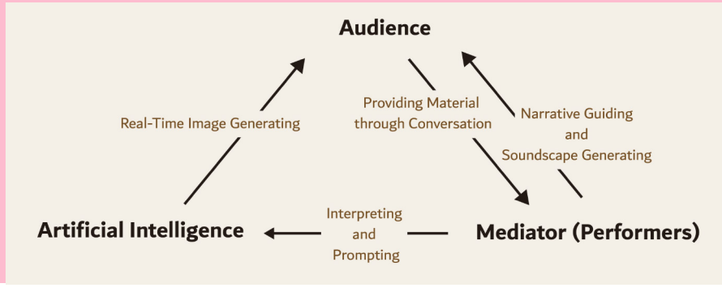
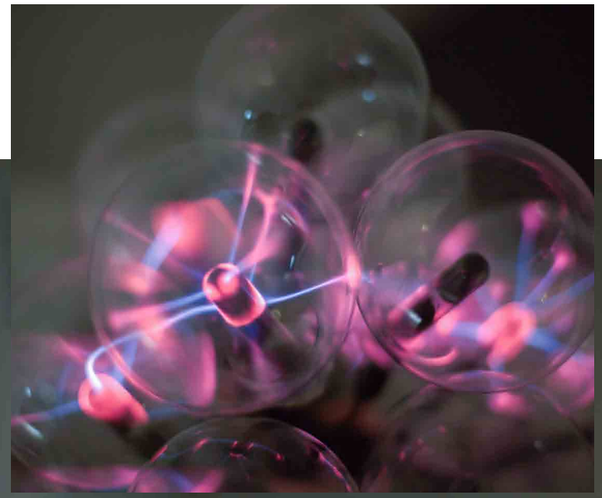
The research began by exploring the influence of the traditional ritual, Guān Luò Yin, on contemporary virtual reality storytelling. Subsequently, harnessing the potential of new media, a new narrative experience system was developed. In our system, performers serve as mediators between AI and the audience, facilitating the creation of personalized narratives and adaptive soundscapes within a virtual reality environment. This triangular co-creation framework transcends the limitations of pre-written scripts, allowing for deeper explorations of inner realms and providing a more personalized story-telling experience. This project has been publicly performed in Taiwan and France over a dozen times. Future studies will concentrate on optimizing the real-time conversational narrative system and gathering extensive feedback to improve and validate its applicability and effectiveness across diverse artistic and cultural contexts.

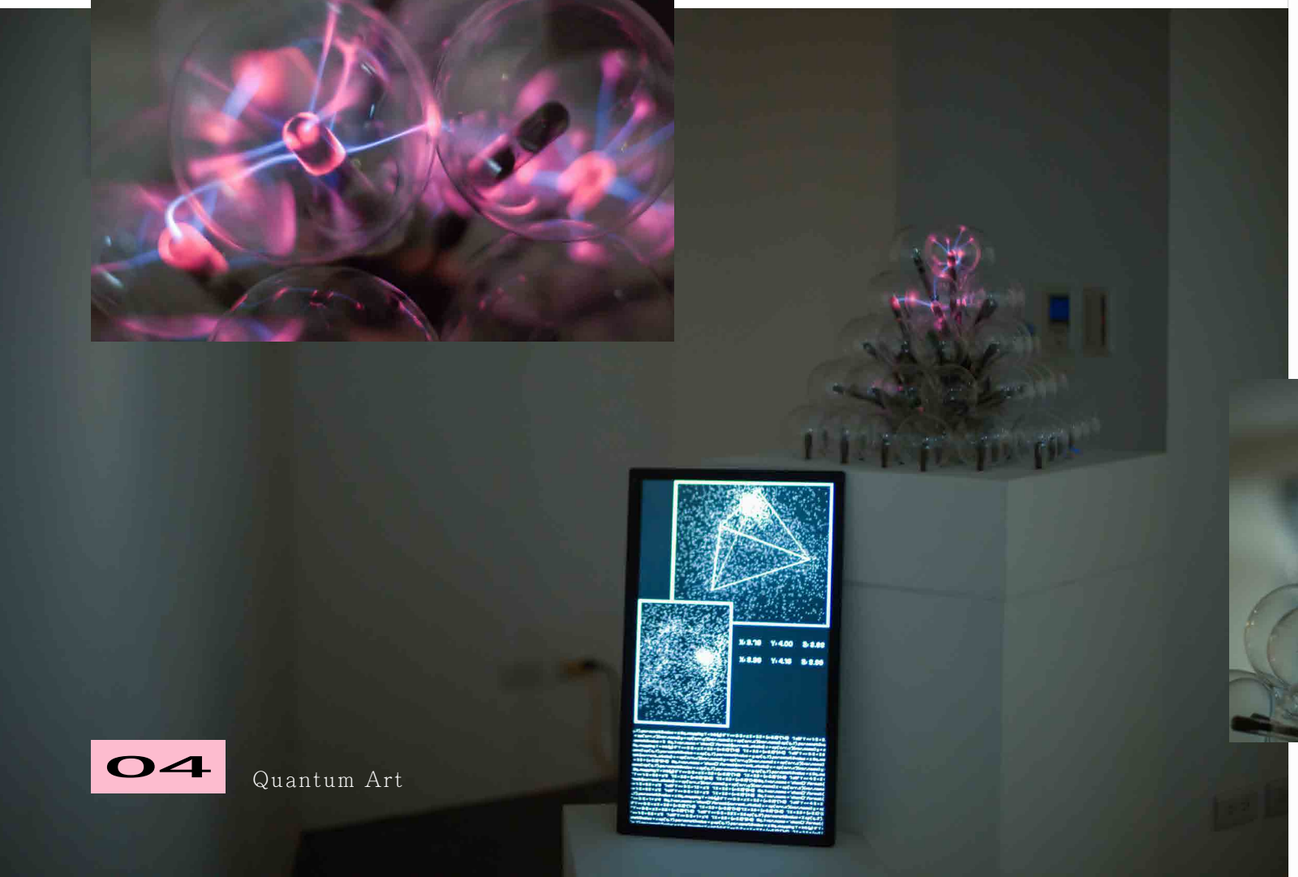


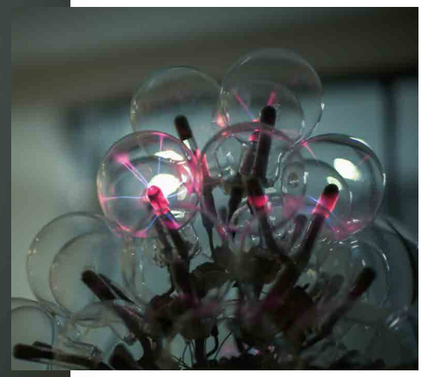
Artist

Peering Through the Collapse

Exhibited work at
Taipei World Trade Center
Digital Art Center, Taiwan







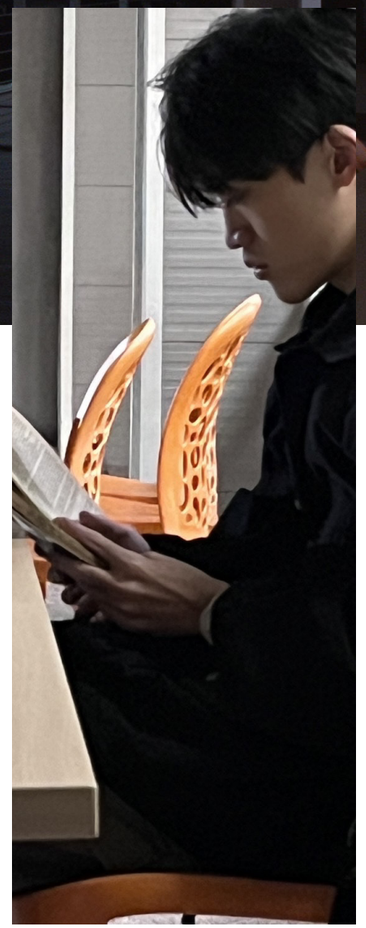
All that we see with the naked eye, including ourselves, is composed of quantum particles. Yet, we find ourselves in a predicament: living within the macroscopic world that emerges after wavefunction collapse, separated from the defining characteristics of the quantum realm—superposition, entanglement, and randomness—by an unbridgeable chasm.

The artists view these collapsed, de-quantized macroscopic experiences as "quantum shells." Modern humanity is surrounded by these shells, imagining, understanding, and applying quantum states through data, but struggling to truly experience them.

Confronted by this forlorn predicament, the artist yearns to traverse the gap, to ferry the quantum world into our physical space, exploring the possibility of experiencing quantum states.

Through this work, the artists also invite audiences to ponder: if we create using these quantum shells, can we truly claim to be making quantum art?

https://youtu.be/JS4LMvRSoyc



The convergence of time and space caused by communication technology in the past 40 years has reached the concept of global village proposed by McLuhan. For example, when we have an appointment and the person is late, we can use messages, voice, video calls, and even positioning. You can even cancel the appointment before the last second.
After removing these technologies, what will waiting become? When we return to the writting generation, or even the earlier oral generation, breaking the accustomed convergence of time and space, the physical experience of waiting is far different from the regular.
Nowadays, it is difficult for us to imagine the so-called sense of time, space and waiting. We do not and cannot go back to experience such feelings. This film constructs an environment where communication technology is removed. The story describes waiting for a person, showing or reproducing the loneliness, uncertainty, and no signal that no longer be experienced.

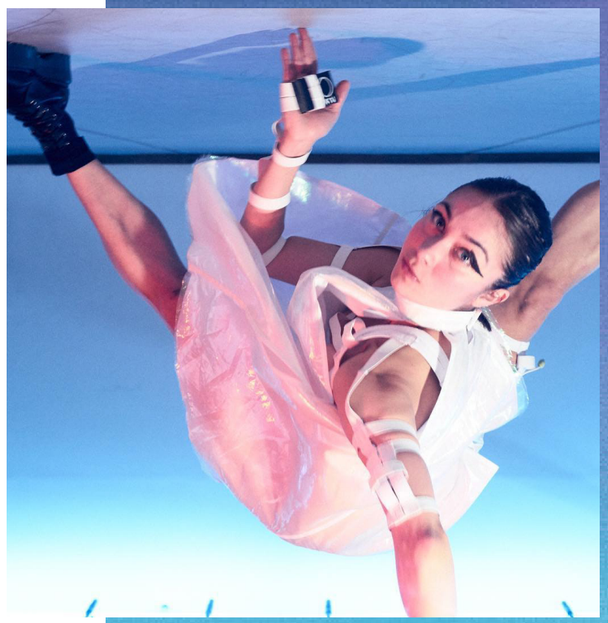
COLOR_EFFECT

Tech execution/Live Video Design

host in WIESE e. G. in Hamburg from 2023/5/18 to 5/20

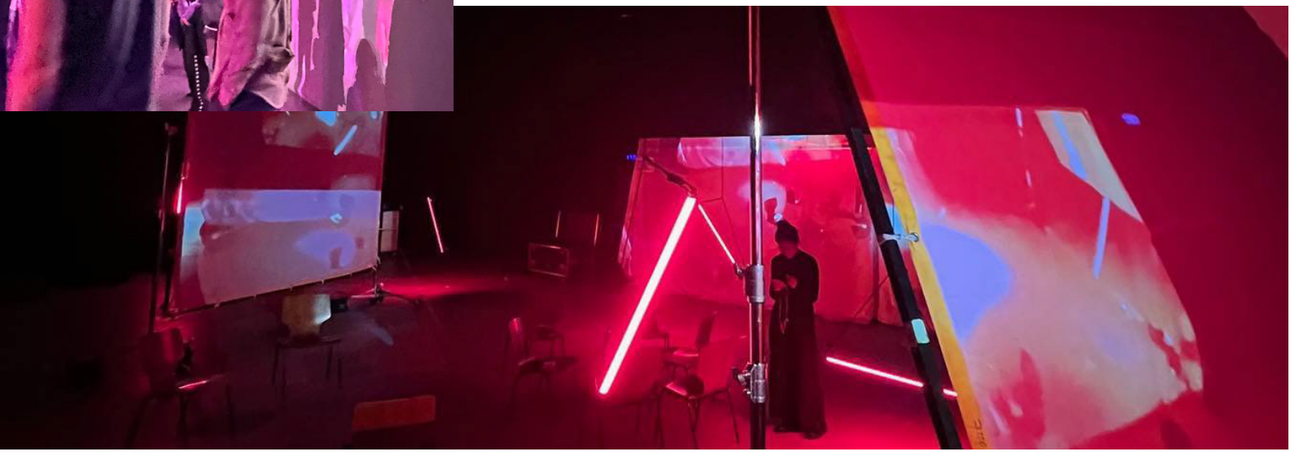
The script illustrates the personal experience of being monitored. The Director uses dancing to narrative the ubiquity of surveillance, controland the exploitation of privacy rights. We create immersive somatosensory shock stimulation, and through well-design dance movements and stage design, we show the physical and psychological state under surveillance.

https://jasminefan.de/project/01-color



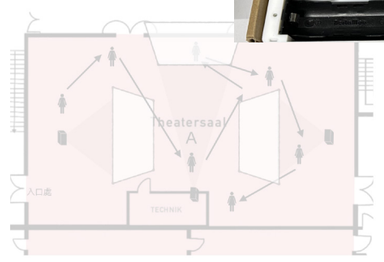
06 Interdisciplinary Performance

I am engaged in visual design for stage projection in a live performance setting. The stage is equipped with four cameras, including two mounted on the dancer. The audiences are filmed and their images are projected onto a large screens, creating an immersive experience that intensifies the theme of surveillance. Using Resolume Arena, the visuals are created in real-time, ensuring that each performance is a unique and singular event.



We designed a stage installation that technology will be used to auto detect whether the audiences and the dancer move, and changing the visibility of the projecting.
The technical team designed a millimeter wave radar system. Many currently mature human body detection devices are easily interfered by any other heat sources. Different from other detection devices, the main source of environmental millimeter waves is the human body, so it is less likely to be interfered by other devices in the theater.

```
nowCriVal_1 = 0;
nowCriVal_2 = 0;
nowCriVal_3 = 0;
nowCriVal_4 = 0;
for (byte i = 0; i < numUNIT; i++)
{
  if (sensorUNIT[i].isDetect == 0)
  {
    nowCriVal_1 += 0;    //灰
  } else if (sensorUNIT[i].isDetect == 1 || sensorUNIT[i].isDetect == 2)
  {
    nowCriVal_1 += 0;   //綠色
  } else if (sensorUNIT[i].isDetect == 3)
  {
    nowCriVal_1 += 20;   //紅色
  }
}
if(nowCriVal_1 > criVal_1) criVal_1 ++;
else if(nowCriVal_1 < criVal_1) criVal_1 --;
```



Useing Processing.serial to communicate between computers and microprocessors. The Processing and Spout function libraries capture the signals of whether people in the area moving obtained by the receivers. My task was the installation and fine-tuning of the radar detectors; the maintenance and fine-tuning of the Java program. The performance site was responsible for monitoring the radar detectors to ensure that all devices operate correctly.

NTHU Offical Graduation Song MV

Director/Writer/Edit/Colorist

https://youtu.be/kfuOX3APyEA?si=4DS69BWffMVcKc1U

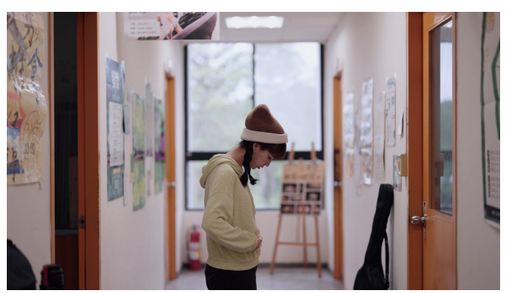
07 Music Video

「We want a very brain new one」

This is the first request from the NTHU Graduation Association and embodies our commitment to creative storytelling. During the scriptwriting process, we reviewed popular high school and university graduation songs from the past three years, aiming to break free from traditional narratives and flowing storyline.

The filming adopts a magical realism approach, telling the story of three freshmen entering NTHU, who find themselves in a dreamlike, ever-changing campus. Over the span of three years, condensed into a symbolic journey, they embark on a series of adventures.

Through this narrative, we explore the bewilderment of navigating a complex academic system, the simple joy of midnight snacks, the frustrations of living through a pandemic, and the immense pressure of facing future academic and career challenges. These experiences are visualized and integrated into the plot in a tangible way. By leveraging surreal realism, we connect various relatable scenes on campus. The five-minute adventure is a microcosm of the journey from enrollment to graduation.



The Dream of Scipio

Director/Camera Operator/Editor

R.O.C. Micro Movie Association_Top 100 Excellence Award

https://youtu.be/UHzsbWcyQoE?si=I0nw9wkmykpymPQR

Dreams occur during the later stages of sleep, characterized by rapid eye movement and a light sleep state. Yet, they feel so vivid, uncertain, and inexplicable, constantly reminding us that dreams may be more than mere illusions. Where do they originate? What exactly is a dream before becoming a dream?

Using a prose-like narrative style and long takes, we aim to highlight dreams' intrinsic nature and characteristics and seek to evoke the surreal, otherworldly quality of dreamscapes.

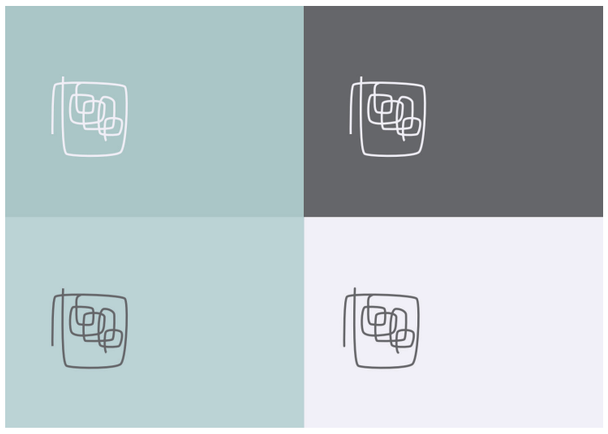
Director / Photographer

https://www.instagram.com/the_white._.studio/?hl=en

White background is a commonly used studio scene for studio photography. In addition to being a good reflective scene and effectively highlighting the subject of the photo, the white studio is an indispensable With any mood and position, a clean background also means that the white studio has unlimited possibilities. The White Studio Project is a joint recording project that uses the most original elements of photography : "freezing time" and "recording"

Initially, participants share a piece of text, which can be a sentence, a word, or even a letter. This serves as a current state that the participants wish to record, which may be a mood, an atmosphere, or a Phenomenon. With this text given by the participants, the White Studio team regarded it as the core and began to spread out. The process of divergence is that team members will make imaginations and connections based on the word. During the discussion, we will slowly get to know the status of the participants when participating in the project, so as to gradually materialize the understanding and thoughts behind the words and transform them into images.
The White Studio started at the end of July, and during August, a total of eight project were completed.



The White Studio_Graphic Design

We designed the way we want to look like, and tried to figure out
who we really are at the same time.

The main color is white with a bit of gray tones rather than a stiff white, makeing it becomes soft and comfortable as the white studio background. Black is also replaced by gray with a softer texture. Two gray-toned, low-saturated blue-greens are chosen to represent the image of the sky, freedom, and boundlessness. The logo uses a more abstract expression. The outermost square is the symbol of the white background, and the multiple squares in the middle are symbols representing the diverse development of the white studio project.
